

WFact — Company Operations Manual

The plain-English manual for how this company runs: from a stranger's first email to a launched website to monthly care revenue. Written for humans; the technical law lives in CLAUDE.md and the pipeline docs.

Last updated: July 2026.

1. What WFact is

WFact is a **website factory**. It serves every company in the group — **DreamSign**, **Bennett & Co**, and bridge-side work — and it does one thing repeatedly and well: it turns a lead into a signed client and a launched, premium, motion-rich website, then keeps earning from that client every month through SEO care. Every project it finishes makes the next one better, because the factory records lessons and reusable mechanisms as it works.

The factory has three kinds of workers:

- **Humans** (Nick the owner, plus admins and project managers) — they sell, approve, and sign. Human judgment is kept for exactly the moments where it matters; everything else is automated.
- **Amir** — the AI chief of staff living inside the Cockpit. He reads the business mail, answers leads, drafts documents, preps calls, and taps your shoulder. He **never** sends, publishes, deletes, or touches money on his own — everything he produces lands in an Approval Inbox for a human click.
- **The main desk** — Claude Code, the build engine. It does the actual research, design, coding, QA, and deployment work, always inside the pipeline's rules. It can be summoned from the Cockpit with one button.

2. The three companies (entities)

Every client belongs to exactly one **entity** — the company that signs them — recorded from day one and worn by every document they ever see:

| Entity | What it is |

|---|---|

| **DreamSign** | The design studio brand (dreamsign.rs) |

| **Bennett & Co** | The business/consulting brand (bennettndco.com) — currently the live mail domain |

| **Bridge** | Bridge-side/partner work |

Offers, contracts, invoices, and emails always carry the signing entity's name, logo line, and legal block. Invoices number themselves sequentially ****per entity per year**** (e.g. BC-2026-001) and come in the entity's branded skin — with an English+Arabic pair when the client is in an Arabic market.

3. The journey: lead → launch → care

The pipeline has eleven stages (0–10). A project moves forward only through a ****gate check**** — an honest pass/fail list. Nothing ever "slides through."

Stage 0 — Onboarding (contact → signed)

A stranger emails ****support@****. Within five minutes, Amir's mail engine has: filed them as a lead in the Pipeline board, sent the entity-branded thank-you email with the ****hosted questionnaire link**** and the Calendly link, and buzzed your phone. If they go quiet, polite chasers go out on day 2 and day 5 — never more than one per 48 hours. When they book a call, the factory detects it from the Calendly email and preps a ****Call Brief**** an hour before: who they are, what they answered, what to push on.

Before the call, the desk builds the ****proposal**** from their questionnaire — their own pain points quoted back at them, a dated timeline, and a price table whose numbers Nick can edit ****live during the call****, hosted at a private link presentable from any device. The doctrine: ****close on the call, not the day after.**** After the call, the contract is generated from the questionnaire + meeting transcript + the entity's lawyer-approved legal block, and goes out via PandaDoc. When the client signs, the factory notices from PandaDoc's email — and reminds Nick if his countersignature is still missing.

****The three human moments of Stage 0 — the only three:**** the ****sales call**** (a human closes, live), the ****signature****, and the ****deposit confirmation****. Everything else notifies instead of waits.

Stage 1 — Intake

Starts ****pre-filled**** from the questionnaire and transcript — the client is never asked the same question twice. What's still missing (logo files, domain access, photography, who edits content after launch) gets chased explicitly. For Arabic-market clients, this is where the country is recorded — Saudi, UAE, Kuwait, Qatar, Bahrain, Oman all differ in currency decimals, VAT, and weekends. Gate: everything present or waived in writing.

Stage 2 — Research & Story

The factory turns the intake pile into three short documents that everything downstream obeys: ****brand DNA**** (exact colors, fonts, voice, motion personality), the ****story map**** (every page, section by section — what each section *says*, how it moves, what assets it needs, what the client can self-edit later, plus the SEO fields for every page), and the ****Total Spec**** — every layer, value, easing, and asset brief decided ****before any code****. For Arabic-market clients, the

Arabic/RTL decisions (direction, digit system, Arabic font stack, icon mirroring, sign-off order) are locked into the spec here too. ****Human moment: Nick approves the direction.****

Stage 3 — Assets

Every asset slot in the spec gets filled: brand-matched images and video generated (Higgsfield), licensed, compressed, and ****self-hosted****. Clients own their assets — zero third-party hotlinks, ever.

Stage 4 — Homepage Build

The homepage is built completely — real copy, real assets, full motion — exactly to the spec. Before any human sees a link, the build is scroll-recorded and reviewed frame by frame against the spec and the Experience Charter ("eyes before humans"). ****Human moment: Nick's internal approval.****

Stage 5 — Direction Lock

The client sees the homepage. ****Human moments: the client's written approval, and the milestone payment.**** This is the point of no return on direction — changes after this are scope changes.

Stage 6 — Full Build

Every remaining page and section, built to the locked spec, one section at a time, each committed as it finishes. This is also where the ****Owner's Key**** gets wired: the client's own login through which they can edit exactly the texts, images, and prices marked editable — and nothing else. The design cannot be broken from the client's side.

Stage 7 — QA

A written report where every line is verified against reality — performance on a throttled connection, motion on real phones, every form actually submitted, security (a logged-in client can never reach admin surfaces), the Owner's Key round trip, the SEO audit score, and — for Arabic-market clients — the automated RTL scanners plus a human review of the Arabic screenshots. ****Human moment: Nick's ten-minute real-device script****, done personally on his phone.

Stage 8 — Launch & Delivery

Production goes live via the delivery robot to ****Hostinger or the client's own host — never Vercel**** (Vercel is for previews and the internal Cockpit only). The client receives a Closing Report: what was built, how to use their Owner's Key, what the care plan offers. ****Human moment: the final payment.****

Stage 9 — Content Bank (internal)

The launched project becomes an Instagram showcase carousel — art-directed, filed, and queued. Publishing to Instagram happens from the Cockpit with a human click (portfolio permission from the client is a hard gate).

Stage 10 — Post-mortem (internal)

The factory analyzes its own project: what worked, what leaked, what to never repeat. Lessons get written into the permanent ledger — with Nick's veto — so the same mistake cannot happen twice.

After launch, forever: the Care Plan

Monthly, per client on a care plan: an SEO care session runs — rankings tracked, issues fixed, a plain-English report sent. This is the **recurring-revenue engine** and the natural upsell at every launch.

4. The automation layer — what runs itself

The mail engine. Business mailboxes are polled every five minutes. Every inbound email is classified: new lead, booking confirmation, signed contract, client reply, or other. Each type triggers its choreography (templates T1–T6: thank-you, chasers, booking confirmation, welcome, review request). Whether a given template sends itself or waits for a click is a per-switch setting — see the Switchboard below.

Amir (the chief of staff). Summoned from any screen of the Cockpit with the **A** key. He can read everything, draft anything, and do nothing irreversible. Drafts land in the **Approval Inbox**; a human approves, edits, or rejects. He also preps call briefs, drafts invoices, writes offer notes from questionnaire answers, and answers questions about the state of the business.

The summonable main desk. The Cockpit's ► Advance button dispatches a real, headless Claude Code session on the factory repo. It follows the same session ritual, works only inside the current stage, and **can never pass a human gate by itself** — if it hits one, it logs the blocker and stops.

Notifications. Every event that needs a human produces a tap on the shoulder through up to three channels: email, phone push (the Cockpit installs as an app on your phone), and Telegram. Which events reach which channel is a per-person setting; quiet hours and a daily-digest mode exist.

The Autonomy Switchboard — the philosophy. Every automated checkpoint starts at **notify-and-wait**: the machine prepares everything, tells you, and waits. A checkpoint may graduate to **auto-pass** only after **three consecutive projects where you approved it with zero corrections** — autonomy is earned, per checkpoint, never assumed. Two switches can never flip, by design: **Launch** and **Money**. And one red switch — the kill switch — freezes the entire automation layer instantly: mail, chasers, and runs all refuse until it's flipped back.

5. The human moments — the complete list

Everything on this list is a human's job forever. Everything **not** on this list, the machine either does or prepares.

1. **The sales call** — a human closes, live, adjusting price on screen.
2. **The client's signature** (and Nick's countersignature).
3. **The deposit confirmation** — money is confirmed by a human, always.
4. **Direction approvals** — Nick approves brand DNA + Total Spec (Stage 2), the homepage internally (Stage 4).
5. **The client's written direction lock + milestone payment** (Stage 5).
6. **Nick's real-device QA script** (Stage 7).
7. **Launch** (Stage 8) — pressing the button that makes a site public.
8. **Final payment confirmation.**
9. **Every Approval Inbox item** — outbound emails (until a switch earns auto-pass), contracts, captions, invoices.
10. **Instagram publishing** — always a human click, with client portfolio permission on file.
11. **Tax and legal judgment** — Amir drafts invoices; the accountant owns compliance. Contracts fill lawyer-approved text; no machine invents clauses.
12. **Lessons veto** — post-mortem lessons enter the permanent ledger only past Nick.

6. The tools map — what each thing is

| Tool | What it is, in one line |

|---|---|

| **The Cockpit** | The company's control room — a private web app (and phone app): Today, Pipeline, Approval Inbox, Requests, Runs, Money, SEO, Content, Health, Calendar, Team, Settings. |

| **Amir** | The AI chief of staff inside the Cockpit (press **A**). Drafts everything, sends nothing. |

| **The factory repo** | The company's process brain on GitHub — every client's state, every pipeline rule, every lesson. The Cockpit and the desk both read and write it. |

| **The main desk** | Claude Code working in the factory repo — interactive (this desk) or summoned headless from the Cockpit. |

| **Supabase** | The database behind the Cockpit: clients, leads, approvals, notifications, invoices, the works. Also powers each client's Owner's Key. |

| **Vercel** | Hosts the Cockpit (private, behind login) and build previews. **Never** client production. |

| **Hostinger** | Where finished client sites actually live, deployed by the delivery robot. |

| **Namecheap Private Email** | The business mailboxes (bennettndco.com now; dreamsign.rs when purchased). |

| **Calendly** | Call booking; the factory reads its confirmation emails. |

| **PandaDoc** | Contract e-signing; the factory reads its emails, including "your countersignature is missing." |

| **Telegram bot** | Third notification channel — free, instant. |

| **Higgsfield** | Brand-matched image/video generation for client assets (Stage 3) and proposal teasers. |

claude-seo	The SEO engine woven through Stages 2/4/6/7 and every monthly care session.
senior-arabic-rtl-dev	The Arabic/RTL engineering skill — loaded **only** for Arabic-market clients, from spec (Stage 2) through QA scanners (Stage 7).
Content Bank	The internal library of finished carousels and reusable section mechanisms.

7. Quickstart — Owner (Nick), one page

Your day starts on your phone. Open the Cockpit app → **Today**. It tells you where every deal stands and whose move it is. The badge on ♦ Amir is your to-do count.

- **A buzz arrived** → tap it. It deep-links to the exact card: an approval, a gate, a payment, a blocked run. Approve ✓, edit then approve, or reject with a note. That's 80% of your job in the machine.
- **A call is coming** → the Call Brief arrives an hour before. Read it in one minute; walk in prepared.
- **On a sales call** → open the proposal link from anywhere, present, edit the price live, close.
- **Something needs the desk** → the Requests room, or just tell Amir; he queues it. The desk picks it up next session (or press ► Advance in Runs to summon it now).
- **Approve a stage** → say so in this chat or via a gate run; gates record it. Money stages record the payment too.
- **Weekly, two minutes** → Settings: check Amir's cost tiles; glance at the Switchboard. Health room: anything red is a conversation with the desk.
- **Something scares you** → the kill switch (Settings) freezes all automation instantly. Then tell the desk what happened.
- **Never do:** approve by memory (open the artifact), let anyone bypass a gate, or ship anything client-facing without its entity's identity.

8. Quickstart — Admin, one page

You run operations when Nick is selling. You see everything except what's owner-only (Team room, audit log, Switchboard; Money only if granted).

- **Morning:** Cockpit → Today. Clear what's yours in the Approval Inbox: routine outbound emails, caption drafts, questionnaire follow-ups.
- **Leads:** watch the Pipeline board's lead column. The machine files and chases leads itself — your job is spotting the stuck ones (waiting badges) and nudging: a personal reply beats a template chase.
- **Documents:** Amir drafts offers, contracts, and invoices; you sanity-check names, numbers, and entity before they reach Nick or the client. Wrong-entity paperwork is the cardinal sin.
- **Requests:** anything a client emails that needs the desk (a text change, a new section) goes into the Requests room with the client's slug — never straight to a developer chat. The queue is the single pipe.

- **Escalate, don't improvise:** money questions, legal wording, scope changes, and anything touching Launch go to Nick. When a run blocks on a gate, that's by design — tell Nick, don't look for a workaround.

9. Quickstart — Project Manager, one page

You own client projects through the pipeline. You see your assigned clients only; money is hidden.

- **Your board is the Pipeline room.** Each client card shows the stage, what's blocking, and whose move it is. Your job: keep the baton moving and honest.
- **Feed the machine early.** Stages stall on missing content, not missing code. Chase logos, photos, copy sign-offs, and domain access the day they're first mentioned — Stage 1's checklist is your chase list.
- **Client communication:** replies from clients land classified in the system; answer inside your approval scope, queue the rest. Never promise dates the pipeline hasn't confirmed.
- **Stage etiquette:** you can mark work ready and request a gate run; you cannot pass gates that belong to Nick or the client. A red gate item is information, not an obstacle — surface it.
- **Arabic-market projects:** flag them at intake (country included). The Arabic/RTL skill drives the spec and QA automatically from there; your job is making sure the client's Arabic copy sign-off happens in the right order (primary language first).
- **At launch:** confirm the client got the Closing Report and knows how to use their Owner's Key; book the first care-plan month.

10. Connect the desk (one-time, per computer)

The factory desk needs two things on a new machine: run ``npm install`` once in the factory folder, and create the ``.env`` file with the Supabase address and service key (the full click-by-click lives with Nick; keys are never pasted into chats or committed — the file is gitignored). Until ``.env`` exists, the desk's queue and upload tools say so plainly and do nothing.

11. When something breaks

The rule for humans is the same as the rule for machines: **stop, don't improvise past a broken gate.** State plainly what broke, what was tried, and the options. The kill switch exists for "I don't know what it's doing" moments — freezing the machine is always safe, because nothing the machine does is irreversible without a human click anyway.

The deeper law, stage by stage: ``.CLAUDE.md`` (the thirteen directives), ``.pipeline/0–10``, and the lessons ledger — which this manual summarizes but never overrides.
