

WFACT SOP 2 — PRODUCTION PIPELINE (STAGES 1–8)

How a signed client becomes a launched website. The deeper law lives in CLAUDE.md (the thirteen directives) and pipeline/1–8. Last updated: July 23, 2026 (verified against the live factory).

1. The gate principle

The pipeline has eleven stages (0–10). A project moves only through a **GATE CHECK** — an honest pass/fail list verified against reality. Nothing ever "slides through." The summonable main desk can carry any stage headlessly, but it **CAN NEVER PASS A HUMAN GATE BY ITSELF** — it logs the blocker and stops. Cockpit approval taps ARE the gate evidence.

2. Stage 1 — Intake (pre-filled)

Starts pre-filled from the questionnaire and transcript — the client is never asked the same question twice. Missing items (logo, domain access, photography, who edits after launch) get chased the day they are first mentioned. Arabic-market clients: the country is recorded here — Saudi, UAE, Kuwait, Qatar, Bahrain, Oman differ in currency decimals, VAT, and weekends. Gate: everything present or waived in writing.

3. Stage 2 — Research, Story & the Total Spec

The intake pile becomes three documents everything downstream obeys: **BRAND DNA** (exact colors, fonts, voice, motion personality) · **STORY MAP** (every page, section by section: message, motion, assets, self-editable zones, SEO fields) · **THE TOTAL SPEC** — the film script of the site: every layer, value, easing, and asset brief decided BEFORE ANY CODE.

THE CONCEPT PITCH (new ritual): before the full spec, the Director presents 2–3 NAMED concepts, the lead one marked "(Recommended)" — each with a narrated scroll walkthrough, its experience-mode, chapter count, and credit estimate. The owner (or client) picks or blends; "you choose" means take the recommended and go.

EXPERIENCE-MODE (in every spec): *standard-cinematic* (the classic build) · *scroll-film-A* (the whole page is one continuous shot in pure code — no asset cost) · *scroll-film-B* (chained generated footage scrubbed on canvas — the flagship "Film Site" look). Lane choice is a Director + Cost-Sentinel decision, never a client burden; Lane B always asks the owner first with the quoted credit total. **THE JOURNEY** (where the camera starts, where it ends, what changes) is asked in the client questionnaire and anchors every film spec. The Experience Director finds the brand's protagonist and composes mechanisms into one coherent world; Arabic/RTL decisions lock here too. **HUMAN MOMENT**: the owner approves the direction (brand DNA + Total Spec + styleframes).

4. Stage 3 — Assets

Every asset slot filled: brand-matched images and video generated in-house (Higgsfield, palette-locked), compressed, and SELF-HOSTED — zero third-party hotlinks, ever. Protagonist footage first. **Scroll-film-B chains:** each clip starts from the literal extracted last frame of the previous one, junction-gated; the whole chain is validated cheap (480p drafts) before mastering once at 1080p; audio stays off (it silently triples the bill); credits are quoted and approved before the first draft is generated.

5. Stage 4 — Homepage build

The homepage is built completely — real copy, real assets, full motion — exactly to the spec; deviation is a bug, not creativity. Every build implements the **inspection contract**: the page can land pre-scrolled at any position for frame-exact review, and reports itself ready only when truly ready. Before any human sees a link, the build is scroll-recorded and reviewed frame by frame against the spec and the Experience Charter — **EYES BEFORE HUMANS** — including the jank test (worst frame under 50 ms, never judged on averages). **HUMAN MOMENT:** the owner's internal approval.

6. Stage 5 — Direction lock

The client sees the homepage. **HUMAN MOMENTS:** the client's written approval, and the milestone payment (invoice drafted by Amir; the owner's Approve mints the payment link and emails it). The point of no return on direction — later changes are scope changes, quoted separately.

7. Stage 6 — Full build + the Owner's Key

Every remaining page, built to the locked spec, one section at a time, each committed as it finishes. The **OWNER'S KEY** is wired here: the client's own login edits exactly the texts, images, and prices marked editable — nothing else; the design cannot be broken from the client's side. E-commerce: story pages get the full cinematic treatment; shop pages (listings, cart, checkout) are conversion-first by law.

8. Stage 7 — QA + the security pass

A written report where every line is verified against reality: performance on a throttled connection, motion on real phones, every form actually submitted, the Owner's Key round trip, the isolation attack-test (one client's login can never touch another's content), admin surfaces unreachable by normal accounts at both app AND database layers, all working credentials rotated, no secrets in the repo, and the SEO audit score. Arabic-market clients: automated RTL scanners plus a human review of the Arabic screenshots. (*Deeper automated scanning — dependency audit, secret scanners — planned, not yet wired.*) **HUMAN MOMENT:** the owner's ten-minute real-device script, done personally on his phone.

9. Stage 8 — Launch & delivery

Production ships via the delivery robot to **HOSTINGER** or the client's own host — **NEVER VERCEL** (previews and the internal Cockpit only). The robot uploads the finished site only — never raw clips or build intermediates. The human Ship Checklist covers the ~10 minutes only hands can do: create the site in Hostinger, paste deploy secrets, point the domain (A-record only). The client receives the Closing Report: what was built, real scores, the Owner's Key manual, the care-plan offer, the review link, and the portfolio-permission ask. **HUMAN MOMENTS**: the launch click, and the final payment confirmation.

10. What the machine enforces throughout

Spec before code · commit and push after every completed section · real content only, missing content chased never faked · the Experience Charter outranks taste debates (living canvas, scroll-owned motion, one coherent world, any frame a poster) · a blocked gate is information, not an obstacle — surface it, never work around it.
