

WFACT SOP 3 — POST-LAUNCH, AUTOMATION & TEAM OPERATIONS

Everything after launch, the automation layer, and how each role works. Last updated: July 23, 2026 (verified against the live factory).

1. Stage 9 — Content Bank + the Publisher

Every launched project becomes a showcase carousel — art-directed with a fresh concept each time, filed and queued. Publishing happens from the Cockpit's Content room through the **PUBLISHER**: Instagram (full carousel), Facebook Pages (full carousel), and LinkedIn company pages (hook slide + caption-as-post) — one button per connected account, each guarded by the client's portfolio permission on file + an approved caption + a human click with a 3-second undo. Account tokens live in an owner-only vault. TikTok / YouTube Shorts / X are documented connector slots, not yet built.

2. Stage 10 — Post-mortem (internal)

The factory analyzes its own project: time per stage and why, design self-critique, client-experience friction, what to never repeat. Lessons enter the permanent ledger — WITH THE OWNER'S VETO. The same mistake cannot happen twice. Bank-worthy invented mechanisms are nominated for reuse.

3. The Care Plan — the recurring-revenue engine

Monthly, per care client, the session opens with the **AUDIT-FIRST LAW** — no content work before hunting four diseases in Search Console: cannibalization, decay, striking-distance queries (positions 8–20 — the cheapest wins in SEO), and cluster gaps. The keyword map is organized into **TOPICAL CLUSTERS** (one pillar per money topic; orphan articles are banned). Care Basic: audit + fixes + report, plus **GBP CARE** for local clients (review replies drafted in the client's voice, Google posts, profile completeness — the most visible deliverable they'll ever see). Care Growth adds quarterly content briefs, backlink outreach drafts (earned links only — listicle targeting: get the client into the "best X in Y" lists that already rank), and a quarterly sourced **STATISTICS PAGE** — the linkable asset journalists actually cite. Data is pulled, never invented; every action lands in the care log with a commit or draft to point at. *(A 24/7 uptime watch on shipped sites: planned, not yet built.)*

4. The automation layer — what runs itself

The mail engine: mailboxes polled every five minutes; inbound mail classified (lead / booking / signed / reply / other); first replies personally WRITTEN by Amir per the personalization law; chasers d2/d5; bookings and signatures detected from Calendly/PandaDoc notifications arriving at the owner's events-only mailbox. **Branded email:** everything client-facing wears the entity's

house design with the CEO's photo signature. **Notifications:** every event that needs a human reaches email + phone push + Telegram, per-person and per-category configurable, with quiet hours and digest mode. **The Call Brief:** written by Amir one hour before every booked meeting, once per meeting, into the Inbox. **Invoices:** Amir drafts at money gates (deposit / milestone / final / care); the owner's Approve mints a Stripe payment link (once the key exists) and emails invoice + link; entities whose legal block awaits the accountant are approved-and-held, never emailed. **The summonable desk:** ▶ Advance dispatches a real headless build session that obeys every law and stops at human gates. **Factory governance:** partner changes to the factory itself arrive as pull requests needing TWO approvals; each PR becomes a plain-English Factory Update card in the Inbox — Approve = a real GitHub review; the owner pushes freely. **THE AUTONOMY SWITCHBOARD:** every checkpoint starts at notify-and-wait; auto-pass is EARNED per checkpoint after three consecutive zero-correction projects; **Launch and Money never flip — by design;** the global kill switch (usable by any admin — protection is for everyone) freezes mail, chasers, and runs instantly.

5. The human moments — the complete list

The sales call · the client's signature and the owner's countersignature · the deposit confirmation · direction approvals (Stage 2 spec, Stage 4 homepage) · the client's written direction lock + milestone payment · the owner's real-device QA script · launch · the final payment confirmation · every Approval Inbox item until its switch earns auto-pass · social publishing · tax and legal judgment (Amir drafts, the accountant owns compliance) · the lessons veto.

6. The tools map — one line each

Cockpit — the control room (phone-installable): Today's Focus, Pipeline, Inbox, Runs, Money, SEO, Content, Health, Calendar, Team/Settings. **Amir** — the chief of staff (press A anywhere). **Factory repo** — the process brain on GitHub; protected main, partner PRs need two approvals. **Supabase** — the database behind the Cockpit and every Owner's Key. **Vercel** — Cockpit + previews only. **Hostinger** — where client sites live. **Namecheap Private Email** — the mailboxes. **Calendly / PandaDoc** — booking and e-signing, both watched automatically. **Telegram bot** — third notification channel. **Higgsfield** — in-house image/video generation. **claude-seo** — the SEO engine. **scroll-film-studio** — the Film Site engine. **senior-arabic-rtl-dev** — Arabic/RTL law for GCC clients.

7. Quickstart — Owner

Your day starts on your phone: Cockpit → **Today's Focus** — everything open in one feed, new leads included; star ☀ up to three things (or accept Amir's pick) and the day is won. A buzz deep-links to the exact card — approve, edit-then-approve, or reject with a note; that is 80 percent of your job in the machine. Call briefs arrive an hour before meetings. Proposals present from any device with live-editable pricing. Anything for the desk goes through Requests or Amir. Weekly two minutes: Health's cost tiles and the Switchboard. Scared? The kill switch is always safe. Never: approve by memory, let anyone bypass a gate, or ship anything without its entity's identity.

8. Quickstart — Admin

You run operations when the owner is selling — full access including Money; owner-only: Team, Switchboard, audit log, token vault. Morning: clear your Inbox tabs (Approvals · Requests · Factory Updates). Watch the lead column for stuck deals — a personal reply beats a template chase. Sanity-check names, numbers, and ENTITY on every document. Everything for the desk goes through Requests — the single pipe. You can hit the kill switch. Escalate money, legal wording, scope changes, and anything touching Launch.

9. Quickstart — Project Manager

You see your assigned clients only; money is hidden. Your board is the Pipeline room: keep the baton moving and honest. Stages stall on missing content, not missing code — chase logos, copy, and access the day they are first mentioned. Answer client replies inside your approval scope; queue the rest. You can request gate runs; you cannot pass gates that belong to the owner or the client. Arabic-market projects: flag the country at intake; the RTL law drives spec and QA automatically. At launch: confirm the Closing Report landed, the client can use their Owner's Key, and the first care month is booked.

10. When something breaks

Same rule for humans as machines: stop, do not improvise past a broken gate. State plainly what broke, what was tried, and the options. The kill switch exists for "I don't know what it's doing" moments. One-time desk setup per computer: npm install in the factory folder plus the .env file with the database keys — keys are never pasted into chats or committed.
